

**2N IP FORCE - secure door set (i/o module, tamper switch, security relay)**

**Manufacturer:** 2N

**Reference:**H9151198SET

**Price:** 205,70€

**Description:**

The **security relay** is a simple accessory which prevents doors from being opened with a 12V battery. Such a battery allows burglars to open low-power locks if they reach the cables connecting the intercom/reader to the lock. Install the relay between the intercom/reader and the lock. Then pair the security relay with the 2N device. Once set up, the lock will only open if the relay identifies the specific signal sent from the intercom/reader.

The **tamper switch** is designed to detect intrusion into the intercom's frame and will activate an alarm if it detects intrusion. What if you also want to prepare more complex scenarios which activate when an intercom is opened without authorization? The **I/O module** allows you, for example, to set the intercom to take photos and contact the appropriate security agency.
